

Task 1

- a. From the Requirements and the website that John already made I would go along with the Progressive Web App framework.
- b. Native App, Even though he has the money and the time I was considering to use native but since he needs his website updated and integrate the features I did not go with it

Hybrid apps , hybrid app wont work because it has slow performance and functionality Limitations.

- c. John wanted to build an app for existing site and since progressive web app is camouflage as a native mobile application it would be perfect for his requirements because the framework is fast and had offline functionality.
- d. Download option for the songs he posted so that the users can listen to the songs offline without online requirements
- e. Spotify, Deezer and SoundCloud
Soundcloud will be a close competitor for John's music streaming app because it also have features like requesting music and chats.
